Dynamics of Development: Experiments and Inferences

Selected Papers On Developmental Biology

By **Paul A. Weiss**

*The Rockefeller University
New York, New York*

A unique selection of the author's published articles carefully chosen for their importance to the fields of developmental and cellular biology. Previously scattered over a wide variety of media and often inaccessible, the material in this integrated presentation is a synthesis of forty years of study in areas as diverse as regeneration, neuronal specificity, growth control, cell locomotion, and macromolecular tissue organization. The integrative "systems" approach developed by the author is now standard in the physical and behavioral sciences. This approach is demonstrated through his analytical experimentation and theoretical interpretation of structure, adaptation, behavior, differentiation, and dynamics of biological systems.
